About 1Kosmos

1Kosmos is changing the way the world authenticates. Our solution proves a user’s identity at every authentication, improving the balance between identity and access assurance with user experience.

As a result, our customers unleash their digital business because they know who’s behind the device. 1Kosmos binds a verified identity and an advanced biometric to a user’s account, eliminating the need for usernames and passwords. As a result, each access event is validated against a real, verified identity, enabling organizations to mitigate password based attacks and improve revenue-generating consumer digital services with an exceptional and secure user experience.

By knowing the user behind the device, organizations can tackle big issues:

- Eliminate phishing attacks
- Prevent ATO attacks
- Eliminate 3rd party and contractor hijacking
- Stop synthetic identity fraud
- Accelerate new products and services
- Reduce user friction and improve the user experience
- Provide user controlled privacy

1Kosmos BlockID is the only platform certified to both the FIDO2 standard and the NIST 800-63-3 guideline that addresses this challenge by:

- Providing the highest level of digital biometric identity and authentication assurance with superior interoperability
- Delivering a digital identity wallet that is a reusable verified credential only accessible by and under control of the user
- Privacy by design secures personal information under user control and eliminates the threat of a data breach
- Self-service document and identity verification automates workflow, alleviates administrative overhead and meets KYC/KYE guidelines
- Using a convenient QR code and LiveID biometric matching defies spoofing and ensures a real person is on the other side of the digital connection
