

Amazon – AWS Cognito

1Kosmos adds verified identity and passwordless access, helping organizations secure their AWS Cognito deployment.

Multi-factor authentication (MFA) enhances security for web and mobile applications by requiring additional forms of identification beyond a password. It helps reduce the risk of account takeover, phishing attacks, and password theft. Delivering a frictionless user experience with MFA often requires support for multiple authentication methods across diverse users and devices. However, achieving this through a single vendor has traditionally been difficult—leading to authenticator sprawl.

The 1Kosmos Advantage

The Amazon-tested integration ensures quick integration into an AWS Cognito instance. Once deployed users will authenticate via any of our methods depending on the business need, the risk profile of the activity, and the security requirement for each access request.

By implementing 1Kosmos, organizations can deploy any of seven identification methods, including:

- Passwordless:
 - Device Biometrics FaceID / TouchID
 - LiveID
 - 1Key, FIDO Key or Passkeys
 - Windows Hello
 - Mac TouchID
- Traditional MFA methods:
 - Push notification
 - Email/SMS/Token

Our identity-based authentication differentiates us, tying a proofed and verified identity to the access request. This means that the user's biometric is the authentication method.

By implementing 1Kosmos, users will have a consistent and secure user experience. 1Kosmos easily exists alongside any AWS Cognito deployment helping organizations improve their security posture and protecting customer accounts from ATO and phishing attacks.

Organizations can deploy 1Kosmos with confidence as our authentication and identity verification capabilities are certified against NIST 800.63.3, FIDO2, and ISO/IEC 30107-3 standards. Additionally, we comply with the strictest SOC2, ISO 27001 and GDPR certification standards for the handling and retention of sensitive data.

Using 1Kosmos Passwordless MFA with Amazon Cognito enables the best adaptive MFA methods such as biometrics, FIDO2 , or OTP through email and SMS that meets the needs of any application ecosystem.

Amazon – AWS Cognito

Easy Deployment

Deploy and procure 1Kosmos from the AWS Marketplace to implement phishing resistant passwordless MFA that delivers a frictionless user experience through non-spoofable, live biometrics with verified identity.

Access Assurance

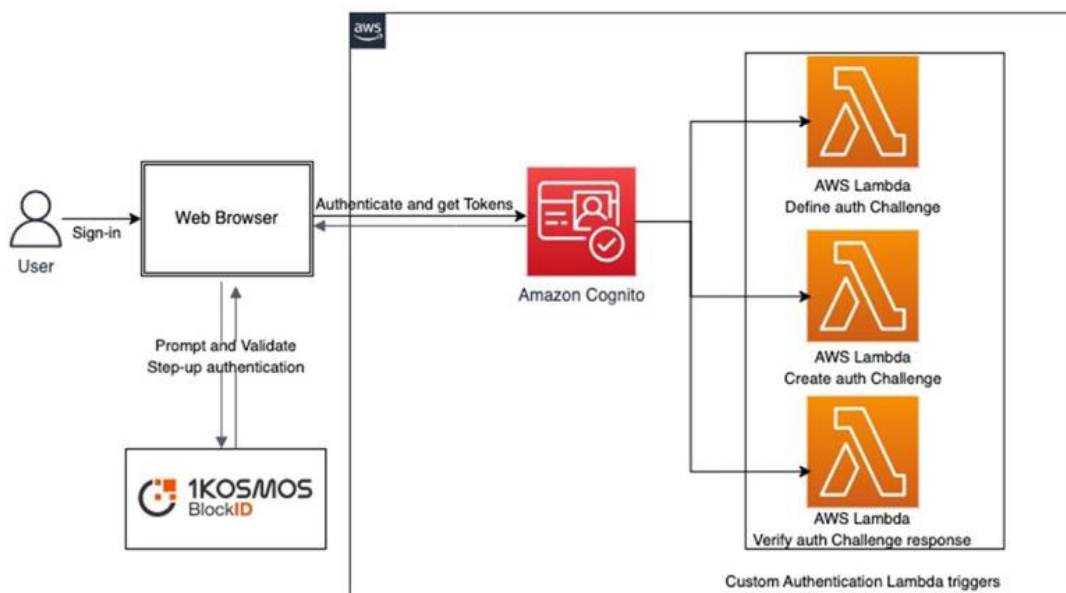

Deliver a high assurance for users accessing applications and services. This way, verified users authenticate and not synthetic users. Users utilize a public/private key pair via FIDO2 standards, which means every access attempt physically verifies the customer, eliminating phishing and ATO attacks.

Identity Verification

1Kosmos identity proofing can verify identity up to a certified IAL2 standard. To do so, 1Kosmos can verify government issued IDs like driver's licenses, passports, or National IDs and other forms of identification like banking/telco accounts, email, social security numbers, and phone numbers to provide organizations assurance users are who they claim to be.

Password Reset

When passwords are still required in the user journey, users can reset their password through 1Kosmos, streamlining the user experience.

1Kosmos Features & Benefits

App and Appless Workflow: Organizations can implement an authentication and/or verification workflow that utilizes an app-based or appless experience. In an appless workflow, authentication and verification are completed through a browser.

User Experience: Simple user onboarding and convenient access anywhere, anytime and on any device.

Customer Authentication: 1Kosmos consolidates authentication methods and lays the foundation for a strategic transition to our identity based passwordless approach.

Privacy by Design: Users determine what data to share at each access request. There's no honeypot of data accessible by 1Kosmos, administrators or hackers.

Reasons to Consider

- Passwordless MFA with FIDO Passkey support
- Flexible SDK for easy integration into existing workflows
- FIDO2, NIST 800-63-3, ISO/IEC 30107-3 certifications
- Customizable user journeys for both appless and app-based experiences

About 1Kosmos

1Kosmos enables remote identity verification and passwordless multi-factor authentication for workers, customers and residents to securely transact with digital services. By unifying identity proofing, credential verification and strong authentication, the 1Kosmos platform prevents identity impersonation, account takeover and fraud while delivering frictionless user experiences and preserving the privacy of users' personal information. 1Kosmos performs millions of authentications daily for government agencies and some of the largest banks, telecommunications, higher education, and healthcare organizations in the world.
