Stopping Scattered Spider at the Identity Layer

How airlines can protect against identity-based cyberattacks before it's too late.

1KOSMOS

Scattered Spider isn't coming.

It's here.

Recent victims from a variety of industries, like airlines and entertainment:

HAWAIIAN AIRLINES®

CAESARS ENTERTAINMENT®

MGM RESORTS INTERNATIONAL™

WESTJET

Attackers don't hack systems. They trick people.

Airlines are ideal for identity-based attacks:

- **Busy help desks under pressure**

- **Complex identity systems**

- **Vendors and contractors with weak links**

- **High-value data and zero downtime tolerance**

Scattered Spider exploits:

- **Social engineering —** convincing help desks

- **MFA bypass —** SIM swaps, fatigue attacks

- **Vendor infiltration —** weak contractor security

The Challenge:

An attacker poses as a pilot who lost access during a layover. Traditional help desks reset accounts.

The Defense:

Identity-first security. No biometric match, no access. Attack stopped.

Verifiable biometric authentication

- No passwords, no phishable MFA
- Access tied to verified identity
